Please circle/check which certification you are applying the course CEU’s.

Wastewater Treatment______ Other __________________________

Your certificate will be mailed to you in about two weeks.

Technical Learning College PO Box 3060, Chino Valley, AZ 86323
Toll Free (866) 557-1746 Fax (928) 272-0747 info@tlch2o.com

If you’ve paid on the Internet, please write your Customer#_____________________

Please invoice me, my PO#_____________________________________________________

Please pay with your credit card on our website under Bookstore or Buy Now. Or call us and provide your credit card information.

We will stop mailing the certificate of completion we need your e-mail address. We will e-mail the certificate to you, if no e-mail address; we will mail it to you.
DISCLAIMER NOTICE
I understand that it is my responsibility to ensure that this CEU course is either approved or accepted in my State for CEU credit. I understand State laws and rules change on a frequent basis and I believe this course is currently accepted in my State for CEU or contact hour credit, if it is not, I will not hold Technical Learning College responsible. I fully understand that this type of study program deals with dangerous, changing conditions and various laws and that I will not hold Technical Learning College, Technical Learning Consultants, Inc. (TLC) liable in any fashion for any errors, omissions, advice, suggestions or neglect contained in this CEU education training course or for any violation or injury, death, neglect, damage or loss of your license or certification caused in any fashion by this CEU education training or course material suggestion or error or my lack of submitting paperwork. It is my responsibility to call or contact TLC if I need help or assistance and double-check to ensure my registration page and assignment has been received and graded. It is my responsibility to ensure all information is correct and to abide with all rules and regulations.

State Approval Listing Link; Check to see if your State or Agency accepts or has pre-approved this course. Not all States are listed. Not all courses are listed. If the course is not accepted for CEU credit, we will give you the course free if you ask your State to accept it for credit.

Professional Engineers; Most states or agencies will accept our courses for credit but we do not officially list the States or Agencies. Please check your State for approval.

State Approval Listing URL...

You can obtain a printed version of the course from TLC for an additional $69.95 plus shipping charges.

AFFIDAVIT OF EXAM COMPLETION
I affirm that I personally completed the entire text of the course. I also affirm that I completed the exam without assistance from any outside source. I understand that it is my responsibility to file or maintain my certificate of completion as required by the state or by the designation organization.

Grading Information
In order to maintain the integrity of our courses we do not distribute test scores, percentages or questions missed. Our exams are based upon pass/fail criteria with the benchmark for successful completion set at 70%. Once you pass the exam, your record will reflect a successful completion and a certificate will be issued to you.
Nutrients & Microbes CEU Course Answer Key

Name ___________________________ Telephone # ________________

Did you check with your State agency to ensure this course is accepted for credit?

Method of Course acceptance confirmation. Please fill this section

Website __ Telephone Call___ Email____ Spoke to_________________________

Did you receive the approval number, if applicable? ________________

What is the course approval number, if applicable? ____________________

You are responsible to ensure that TLC receives the Assignment and Registration Key. Please call us to ensure that we received it.

Please circle, underline, bold or X only one correct answer

Please fax the answer key to TLC
(928) 272-0747
Always call to confirm that we received your paperwork.

This course contains general EPA’s CWA federal rule requirements. Please be aware that each state implements wastewater/safety/environmental/building regulations that may be more stringent than EPA’s regulations. Check with your state environmental/health agency for more information. These rules change frequently and are often difficult to interpret and follow. Be careful to not be in non-compliance and do not follow this course for proper compliance.
Please e-mail or fax this survey along with your final exam

Nutrients and Microbes Assignment 1/13/2020  TLC (866) 557-1746
Nutrients and Microbes
CEU Course Assignment

The Assignment is available in Word on the Internet for your Convenience, please visit www.ABCTLC.com and download the assignment and email it back to TLC.

You will have 90 days from the start of this course to complete in order to receive your Professional Development Hours (PDHs) or Continuing Education Unit (CEU). A score of 70 % is necessary to pass this course. If you should need any assistance, please email all concerns and the completed manual to info@tlch2o.com.

We would prefer that you utilize the enclosed answer sheet in the front, but if you are unable to do so, type out your own answer key. Please include your name and address on your answer key and make copy for yourself.

Multiple Choice, please select only one answer per question. There are no intentional trick questions.

Basic Wastewater Treatment Processes

Biological
1. Which of the following wastewater terms involves treatment levels beyond secondary treatment?
   A. Adding Oxygen  
   B. Removing carbon dioxide  
   C. Advanced Treatment  
   D. Physical separation step

2. Masses of microorganisms grow and rapidly metabolized organic pollutants because of the addition of _________________ to wastewater.
   A. Oxygen  
   B. Carbon dioxide  
   C. Secondary treatment  
   D. Physical separation step

Chemical
3. According to the text, chemicals can be used to create changes in pollutants that decrease the removal of these forms by physical processes.
   A. True  
   B. False

Organic Matter
4. Which of the following wastewater terms can cause pollution, if too much of this organic matter in wastewater; it can be devastating to receiving waters?
   A. Iron  
   B. Biodegradable material(s)  
   C. Organic material(s.  
   D. High supply of oxygen

5. Large amounts of biodegradable materials can reduce or deplete _________________ in the water needed by aquatic life.
   A. Outbreaks of these diseases  
   B. Supply of oxygen  
   C. Anaerobic bugs  
   D. pH
Oil and Grease
6. Fatty organic materials from animals, vegetables, and petroleum are quickly broken down by bacteria and can cause pollution in receiving environments.
A. True  B. False

Inorganics
7. According to the text, heavy metals can be discharged with many types of industrial wastewaters are easy to remove by conventional treatment methods.
A. True  B. False

Pollutants, Oxygen-Demanding Substances
8. If the effluent, the treated wastewater produced by a treatment plant, has a high content of organic pollutants or ammonia, it will demand more oxygen from the water and leave the water with less of __________________________ to support fish and other aquatic life.
A. pH  C. Carbon Dioxide
B. Carbon  D. Oxygen

9. Oxygen-demanding substances are usually destroyed or converted to other compounds by __________________________ if there is sufficient oxygen present in the water.
A. Phosphorus  C. Ammonia
B. Abiogenesis  D. Bacteria

Nutrients
10. Which of the following wastewater terms are essential to living organisms and are the chief nutrients present in natural water?
A. Oxygen  C. Carbon, nitrogen, and phosphorus
B. Carbon dioxide  D. Answers A,B and C

11. Which of the following wastewater terms do not remove the phosphorus and nitrogen to any substantial extent?
A. Wuhrmann Process  C. Conventional secondary biological treatment processes
B. Cape Town Process  D. Oxygen and organic waste ditch filter

12. According to the text, nutrients may convert the inorganic forms into mineral form, making them more usable by plant life.
A. True  B. False

13. An excess of nutrients over-stimulates the growth of water plants, the result causes unsightly conditions, interferes with drinking water treatment processes, and causes unpleasant and disagreeable tastes and odors in drinking water.
A. True  B. False

14. Primarily __________________________ but occasionally nitrogen, causes nutrient enrichment which results in excessive growth of algae.
A. Phosphorus  C. Ammonia
B. Nitrifying Bacteria  D. Calcium Hydroxide
Inorganic and Synthetic Organic Chemicals
15. Inorganic and Synthetic Organic Chemicals can cause __________________________ problems, and many are not effectively removed by conventional wastewater treatment.
A. Toxic C. Excessive growth of aerobic bacteria
B. Ecology D. Taste and odor

Primary Treatment
16. Coarse solids are removed from the wastewater in the primary stage of treatment. In some treatment plants, __________________________may be combined into one basic operation.
A. Tertiary Filtration C. Suspended growth process(es)
B. Trickling ditch D. Primary and secondary stages

Preliminary Treatment
17. Large amounts of __________________________ entering a treatment plant can cause serious operating problems, such as excessive wear of pumps and other equipment.
A. Solid(s) C. Grit and sand
B. Finer debris D. Dissolved organic and inorganic constituents

Primary Sedimentation
18. Pollutants that are dissolved or are very fine and remain suspended in the wastewater are easily removed effectively by gravity settling.
A. True B. False

19. When the wastewater enters a sedimentation tank, it slows down and the suspended solids gradually sink to the bottom, this mass of solids is called?
A. Very fine solids C. Primary sludge
B. RAS D. Heavy pollutants

Bacteria Section
20. Bacteria come in a variety of shapes. The bacteria formed like simple shapes, round spheres or balls are called Cocci (singular coccus). The next simplest shape is cylindrical. Cylindrical bacteria are called rods (singular rod).
A. True B. False

21. Many bacteria exist as __________________________ and the study of biofilms is very important.
A. Filamentous Bacteria C. Application-specific bacteria
B. A biofilm D. None of the Above

Peritrichous Bacteria
22. Pleomorphic bacteria can assume a variety of shapes.
A. True B. False

23. Bacteria may be classified according to whether they require oxygen (aerobic or anaerobic) and how they react to a test with Gram’s stain.
A. True B. False
24. Bacteria in which alcohol washes away Gram’s stain is called gram-negative, while bacteria in which alcohol causes the bacteria’s walls to absorb the stain are called Gram-positive.
A. True   B. False

**Shigella dysenteriae**
25. Shigellae are Gram-negative, non-spore-forming, facultatively anaerobic, Pleomorphic bacteria.
A. True   B. False

26. Salmonella is spread by contaminated water and food, causes the most severe dysentery because of its potent and deadly Shiga toxin, but other species may also be dysentery agents.
A. True   B. False

**Salmonella**
27. Salmonellae usually do not ferment lactose; most of them produce hydrogen sulfide that, in media containing______________, reacts to form a black spot in the center of the creamy colonies.
A. Ferric ammonium citrate   C. Alum sulfate
B. Hydrogen sulfide   D. None of the Above

**Fecal Coliform Bacteria**
28. Fecal Coliform Bacteria live in the waste material, or feces, excreted from the intestinal tract. When fecal coliform bacteria are present in high numbers in a water sample, it means that the water has received _______________ from one source or another.
A. Fecal matter   C. Bacterial concentrations
B. Fecal coliform   D. None of the Above

29. Although not necessarily agents of disease, _______________ may indicate the presence of disease-carrying organisms, which live in the same environment as the fecal coliform bacteria.
A. Fecal matter   C. Fecal coliform bacteria
B. Fecal concentration   D. None of the Above

**Filamentous Bacteria**
30. According to the text, filamentous Bacteria function similar to __________since they degrade BOD quite well.
A. Floc forming bacteria   C. Biofilm bacteria
B. Activated sludge   D. None of the Above

31. According to the text, filaments are _______________that grow in long thread-like strands or colonies.
A. Bacteria and fungi   C. Anaerobic to aerobic state Bacteria
B. Facultative Bacteria   D. None of the Above

**Site Specific Bacteria**
32. Aeration and biofilm building are the key operational parameters that contribute to the efficient degradation of organic matter (BOD/COD removal).
A. True   B. False
Facultative Bacteria
33. Most of the bacteria absorbing the organic material in a wastewater treatment system are facultative in nature, meaning they are adaptable to survive and multiply in either anaerobic or aerobic conditions.
A. True      B. False

34. According to the text, usually, facultative bacteria will be ___________ unless there is some type of mechanical or biochemical process used to add oxygen to the wastewater.
A. Anaerobic   C. Aerobic
B. Application-specific bacteria  D. None of the Above

Anaerobic Bacteria
35. Which of the following terms live and reproduce in the absence of free oxygen?
A. Aerobic bacteria  C. Facultative bacteria
B. Anaerobic bacteria  D. None of the Above

36. In order to remove a given amount of organic material in an anaerobic treatment system, the organic material must be exposed to a ________________ and/or detained for a much longer period of time.
A. Anaerobic action  C. Significantly higher quantity of bacteria
B. Absence of free oxygen  D. None of the Above

37. A typical use for ________________ would be in a septic tank.
A. Aerobic bacteria  C. Facultative bacteria
B. Anaerobic bacteria  D. None of the Above

38. Which of the following terms or bugs release hydrogen sulfide as well as methane gas, both of which can create hazardous conditions?
A. Aerobic bacteria  C. Facultative bacteria
B. Anaerobic bacteria  D. None of the Above

Aerobic Bacteria
39. Aerobic bacteria live and multiply in the presence of free oxygen.
A. True      B. False

40. Facultative bacteria always achieve an aerobic state when oxygen is present.
A. True      B. False

41. The metabolism of aerobes is much higher than?
A. Application-specific bacteria  C. Aerobic bacteria
B. Anaerobes  D. None of the Above

42. The by-products of ________________ are carbon dioxide and water.
A. Anaerobic action  C. Aerobic bacteria
B. Application-specific bacteria  D. None of the Above
Protozoans and Metazoans
43. In a wastewater treatment system, the next higher life form above bacteria is?
   A. Nematodes  C. Protozoan(s)
   B. Rotifers     D. None of the Above

44. Which of the following terms or bugs are also indicators of biomass health and effluent quality?
   A. Aerobic flocs   C. Biomass health and effluent quality
   B. Protozoans     D. None of the Above

45. Which of the following terms or bugs are very similar to protozoans except that they are usually multi-celled animals?
   A. Nematodes and rotifers   C. Worms
   B. Metazoan(s)              D. None of the Above

46. Which of the following terms or bugs and the relative abundance of certain species can be a predictor of operational changes within a treatment plant?
   A. Nematodes and rotifers   C. Protozoans and metazoans
   B. Macroinvertebrates       D. None of the Above

Dispersed Growth
47. Dispersed growth is material suspended within the activated sludge process that has not been adsorbed into the floc particles. This material consists of very small quantities of colloidal (too small to settle out) bacteria as well as organic and inorganic particulate material.
   A. True      B. False

48. According to the text, while a small amount of ______________between the floc particles is normal, excessive amounts can be carried through a secondary clarifier.
   A. Denitrification   C. Bulking sludge
   B. Dispersed growth D. None of the Above

Paramecium sp.
49. Which of the following bugs is a medium to large size (100-300 μm) swimming ciliate, commonly observed in activated sludge, sometimes in abundant numbers?
   A. Shelled amoeba(s)   C. Euglypha
   B. Paramecium         D. None of the Above

50. Which of the following bugs is uniformly ciliated over the entire body surface with longer cilia tufts at the rear of the cell.
   A. Paramecium       C. Shelled amoeba(s)
   B. Euglypha         D. None of the Above

51. Paramecium may also be seen paired up with a ___________________ which makes a good diagnostic key.
   A. Shelled amoeba(s)   C. Vorticella
   B. Paramecium         D. None of the Above
Activated Sludge Bugs

52. In the Activated Sludge process, the ____________are also called waste activated sludge.
   A. Organisms C. Mixed liquor
   B. Settled bugs D. None of the Above

53. The first group is the bacteria which eat the dissolved organic compounds is generally four (4) groups of bugs that do most of the “eating” in the ____________process.
   A. Mixed liquor C. Activated sludge
   B. Settled bugs D. None of the Above

54. The second and third groups of bugs are microorganisms known as the free-swimming and ___________. These larger bugs eat the bacteria and are heavy enough to settle by gravity.
   A. Stalked ciliates C. Activated sludge bugs
   B. Suctoria D. None of the Above

55. Which bug feeds on the larger bugs and assist with settling is in the fourth group, known as?
   A. Water bear C. Rotifer
   B. Suctoria D. None of the Above

56. The Bacteria have several interesting properties--their “fat reserve” is stored on the outside of their body and this strange feature?
   A. Fur C. No Mouth
   B. Feet D. None of the Above

57. Once the bacteria have “contacted” their food, they start the digestion process. A chemical Enzyme is sent out through the cell wall to break up the ____________.
   A. Mixed liquor C. Total Dissolved Solids
   B. Organic compounds D. None of the Above

58. The cell is highly engineered and because of this hydrolytic enzyme, it breaks the organic molecules into small units that are able to pass through the cell wall of the ____________.
   A. Mixed bugs C. Bacteria
   B. Compound D. None of the Above

59. In wastewater treatment, the process of using bacteria-eating-bugs in the presence of oxygen to reduce the organics in water is called?
   A. Mixed liquor C. Activated sludge
   B. Oxidation D. None of the Above

60. An asset in settling the bug is its fat storage property and as the bugs “bump” into each other, the fat on each of them sticks together and causes flocculation of the ____________.
   A. Mixed liquor C. Non-organic solids and biomass
   B. Floc D. None of the Above
61. What does facultative mean as far as bugs? What environments are they adaptable to survive and multiply in?
A. Aerobic only           C. Either anaerobic or aerobic conditions
B. Anaerobic only         D. None of the Above

62. The next step as in the text, this substance, which is the activated sludge, is used again by returning it to the influent of the aeration tank for mixing with the primary effluent and ample amounts of air?
A. Carry over           C. Solids biomass
B. RAS               D. None of the Above

63. We need to be able to properly identify the bugs and which commonly found bug is a medium size to large swimming Ciliate, commonly observed in activated sludge, sometimes in abundant numbers.
A. Vorticella           C. Paramecium
B. Euglypha            D. None of the Above

**Vorticella sp.**
64. Which of the following bugs feeds by producing a vortex with its feeding cilia?
A. Shelled amoeba(s)     C. Euglypha
B. Vorticella           D. None of the Above

65. According to the text, if treatment conditions are bad, for example, low DO or toxicity, ___________ will leave their stalks.
A. Shelled amoeba(s)     C. Vorticella
B. Euglypha             D. None of the Above

**Euglypha sp.**
66. Which of the following bugs spines may be single or in groups of two or three?
A. Shelled amoeba(s)     C. Vorticella
B. Euglypha             D. None of the Above

67. The shell of this bug is often transparent, allowing the hyaline (watery) body to be seen inside the shell.
A. Euglypha             C. Euchlanis
B. Shelled amoeba(s)    D. None of the Above

68. Which of the following bugs are common in soil, treatment plants, and stream bottoms where decaying organic matter is present?
A. Shelled amoeba(s)     C. Stalked ciliate
B. Euglypha             D. None of the Above

**Euchlanis sp.**
69. Euchlanis is a swimmer, using its foot and cilia for locomotion. In common with other rotifers, it has a head rimmed with cilia, a transparent body, and a foot with two strong swimming toes.
A. True     B. False
70. Euchlanis is a typical?
A. Euglypha C. Rotifer(s)
B. Shelled amoeba(s) D. None of the Above

Activated Sludge Aerobic Flocs
71. Aerobic flocs in a healthy state are referred to as activated sludge. While aerobic floc has a metabolic rate approximately 10 times higher than anaerobic sludge, it can be increased even further by exposing the bacteria to an abundance of oxygen.
A. True B. False

Problems may appear during the operation of activated sludge systems, including:
72. Which of the following terms’ content in clarified effluent, which may be due to too high or too low solids retention time and to growth of filamentous microorganisms?
A. Organic material C. Biomass health and effluent quality
B. High solids D. None of the Above

73. Which of the following wastewater treatment related terms occurs when sludge that normally settles rises back to the surface after having settled?
A. Denitrification C. Rising sludge
B. Bulking sludge D. None of the Above

74. Which of the following wastewater treatment related terms that which settles too slowly and is not compactable, and caused by the predominance of filamentous organisms?
A. Settling slude C. Bulking sludge
B. Organic material D. None of the Above

Filamentous Organisms
75. Which of the following wastewater treatment related terms reach too high a concentration, they can extend dramatically from the floc particles?
A. Filamentous organisms C. Organic material
B. Floc particles D. None of the Above

Filamentous Bacteria Identification
76. Filamentous Identification should be used as a tool to monitor the health of the biomass when a floating scum mat is suspected.
A. True B. False

77. The foam from Nocardia amarae is usually a ___________ unless algae are entrapped in it, in which case it appears green and brown.
A. Viscous brown color C. Gram-positive, chemoautotrophic, filamentous
B. Staining gram-positive D. None of the Above

78. Nostocoida can also be identified by their starburst effect formations using phase contrast microscopy at 400 to 1000x magnification. After chlorination, a few dead cells sticking out identify stress to this species.
A. True B. False
**Microthrix parvicella**

79. Microthrix parvicella is another common cause of?
   A. Disruptive foaming  
   C. Viscous brown color  
   B. Mixotrophic  
   D. None of the Above

**Sphaeroliticus natans**

80. Sphaeroliticus natans is another filamentous species, and yet it is reputed to increase settleability by branching between flocs, increasing surface area.
   A. True  
   B. False

81. Which of the following terms requires high levels of oxygen are necessary?
   A. Stain gram-negative  
   C. Slower growing filaments  
   B. A strict aerobe  
   D. None of the Above

**Filamentous Bacteria**

82. Different filamentous bacteria such as Microthrix, Sphaerotilus, Nostocoida, Thiothrix or “Type 021N” and others cause?
   A. Bulking for very different reasons  
   C. Sludge bulking  
   B. Dissolved oxygen decrease  
   D. None of the Above

83. There is a potential for instability with ________________ is an acute problem when strict demands on treatment performance are in place.
   A. Organic carbon  
   C. High BOD  
   B. Activated sludge  
   D. None of the Above

**Other Wastewater Treatment Components**
**Biochemical Oxygen Demand**

84. The BOD test has merit as a pollution parameter continues to be debated, ________________ has the advantage of a long period of record.
   A. BOD  
   C. MLSS  
   B. CBOD  
   D. MLVSS

**Application Specific Microbiology**

85. Which of the following terms is the preferred methodology in wastewater treatment affecting the efficiency of biological nutrient removal?
   A. Attached growth  
   C. Application-specific microbiology  
   B. Advanced treatment technologies  
   D. None of the Above

86. Laboratory prepared bugs are more efficient in organics removal if they have the right growth environment, this efficiency is multiplied if microorganisms are allowed to grow.
   A. True  
   B. False

87. To reduce the start-up phase for growing a mature biofilm one can also purchase application-specific microbiology culture from appropriate microbiology vendors.
   A. True  
   B. False
Advanced Methods of Wastewater Treatment

88. As our country and the demand for clean water have grown, it has become more important to produce cleaner wastewater effluents, yet ___________ are more difficult to remove than others.
   A. Biofilm          C. Soluble nutrients
   B. Some contaminants D. None of the Above

89. All WWTPs provide a minimum of?
   A. Biofilm and chemical removal   C. Pretreatment and pollution prevention
   B. Secondary treatment           D. None of the Above

Advanced Treatment Technologies

90. WWTP treatment levels beyond secondary treatment are called advanced treatment.
   A. True   B. False

91. Which of the following terms can be extensions of conventional secondary biological treatment to further stabilize oxygen-demanding substances?
   A. Hydraulic Detention Time       C. Advanced treatment technologies
   B. Activated sludge system        D. None of the Above

92. Advanced treatment may include physical-chemical separation techniques such as adsorption, flocculation/precipitation, membranes for advanced filtration, ________________, and reverse osmosis.
   A. Denitrification process        C. Ion exchange
   B. Organic material               D. None of the Above

Settleometer Test

93. A simple procedure called the Settleometer Test is used to determine the settling characteristics of Mixed liquor.
   A. True   B. False

94. The test requires a settleometer, which is typically a clear plastic cylinder with a capacity of 2 liters. Graduations on the cylinder range from 100 to 1000 cubic centimeters (or milliliters) of Settled sludge per liter.
   A. True   B. False

95. A sample of nitrates should be obtained from the discharge end of the aeration tank, being careful not to include scum in the sampling container.
   A. True   B. False

96. It is a good idea to occasionally record the MLSS concentration volume every 5 minutes while the flocs are settling and prepare a graph of settled activated sludge versus minutes. This allows the operator to see whether bugs are settling too quickly or slowly.
   A. True   B. False

97. Mix the sample well, and fill the settleometer to the 1000 graduation. Immediately start a timer and at the end of 10 minutes record the solids volume in the settleometer.
   A. True   B. False
98. Do not allow the sample to set for more than a few minutes before the settling test is performed. Determine the _______________ in milligrams per liter on a portion of this sample.
A. MLSS concentration C. Nitrates
B. The solids D. None of the Above

99. Solids that settle too quickly may be an indication of ___________ that will probably leave straggler floc in the effluent, while solids that settle too slowly or do not compact well may be washed out of the clarifier during times of high hydraulic load.
A. Settled sludge C. Sludge volume
B. An old sludge D. None of the Above

pH
100. The acidity or alkalinity of wastewater affects both treatment and the environment. Low
A. True B. False

101. pH indicates increasing acidity while a low pH indicates increasing alkalinity.
A. True B. False

Total Dissolved Solids
102. Pure water is tasteless, colorless, and odorless and is often called the universal solvent.
A. True B. False

103. Which of the following wastewater terms refer to any minerals, salts, metals, cations or anions dissolved in water?
A. Total Solids C. Total Suspended solids
B. TDS D. Dissolved solids

104. Which of the following wastewater terms comprise inorganic salts and some small amounts of organic matter that are dissolved in water?
A. Settleability C. Quality of the water
B. Total dissolved solids (TDS) D. Total Solids

105. The TDS test does not provide us insight into the specific water quality issues, such as: Elevated Hardness, Salty Taste, or?
A. Total Solids C. Corrosiveness
B. TDS D. Alkalinity

Total Solids
106. Which of the following wastewater terms refers to matter suspended or dissolved in water or wastewater, and is related to both specific conductance and turbidity?
A. Total Solids C. Corrosiveness
B. TDS D. Alkalinity

107. Which of the following wastewater terms –are the term used for material left in a container after evaporation and drying of a water sample?
A. Total Solids C. Total Suspended solids
B. TDS D. Alkalinity
108. Which of the following wastewater terms—includes both total suspended solids, the portion of total solids retained by a filter and total dissolved solids?
A. Total Solids  C. Corrosiveness
B. TDS  D. Alkalinity

109. Which of the following wastewater terms can be measured by evaporating a water sample in a weighed dish, and then drying the residue in an oven at 103 to 105° C?
A. Total Solids  C. Total Suspended solids
B. TDS  D. Alkalinity

110. The increase in weight of the dish represents the total solids. Instead of total solids, laboratories often measure total suspended solids and/or total dissolved solids.
A. True  B. False

**Total Suspended Solids (TSS)**

111. Total Suspended Solids (TSS) are solids in water that can be trapped by a filter.
A. True  B. False

112. Which of the following wastewater terms can also cause an increase in surface water temperature, because the suspended particles absorb heat from sunlight?
A. Total Solids  C. Total Suspended solids
B. High TSS  D. Alkalinity

113. When suspended solids settle to the bottom of a water body, they can smother the eggs of fish and aquatic insects, as well as suffocate newly hatched insect larvae.
A. True  B. False

114. Which of the following wastewater terms can fill in spaces between rocks that could have been used by aquatic organisms for homes?
A. Oxygen  C. Settling sediments
B. High TSS  D. Suspended sediment

115. Which of the following wastewater terms can include a wide variety of material, such as silt, decaying plant and animal matter, industrial wastes, and sewage?
A. Total Solids  C. Total Suspended solids
B. TDS  D. Alkalinity

116. Which of the following wastewater terms can block light from reaching submerged vegetation?
A. Oxygen  C. Settling sediments
B. High TSS  D. Suspended sediment

117. Wastewater treatment plants are designed to function as "microbiology farms," where bacteria and other microorganisms are fed oxygen and organic waste.
A. True  B. False

118. If light is completely blocked from bottom dwelling plants, the plants will stop producing oxygen and will die.
A. True  B. False
Water Quality Criteria
119. The Clean Water Act directs the EPA to develop criteria for water quality that accurately reflect the latest scientific knowledge about the effects of pollutants on aquatic life and human health.
A. True  B. False

120. The Clean Water Act and the EPA includes specific information on the concentration and dispersal of pollutants through biological, physical, and chemical processes as well as the effects of pollutants on biological communities as a whole.
A. True  B. False

Human Health Criteria
121. EPA scientists research information to determine the levels at which specific chemicals are not likely to adversely affect water quality standard(s).
A. True  B. False

Aquatic Life Criteria
122. Allowable concentrations provide protection for plants and animals that are found in surface waters.
A. True  B. False

Biological Criteria
123. A water body in its natural condition is free from ______________________________, habitat loss, and other negative stressors.
A. Allowable concentrations  C. Acute (short term) and chronic (long term)
B. Harmful effects of pollution  D. Human health and aquatic life criteria

124. The EPA is developing methodologies that states can use to assess the biological integrity of their waters and, in so doing, set protective_________________?
A. Water quality standards  C. Acute (short term) and chronic (long term)
B. Harmful effects of pollution  D. Human health and aquatic life criteria

125. These methodologies will describe scientific methods for determining a particular aquatic community’s health and for maintaining optimal conditions in___________?
A. Allowable concentrations  C. Various bodies of water
B. Water quality  D. Human health and aquatic life criteria

Genera
126. Which of the following terms means the microorganisms that are attached to a surface over which they grow are called “attached growth processes”?
A. Carbonaceous BOD  C. Suspended growth processes
B. Attached growth processes  D. Food-to-microorganism ratio, F/M

Aerobic Processes
127. The most common aerobic processes are: activated sludge systems, lagoons, trickling filters and rotating disk contactors.
A. True  B. False
128. Which of the following terms is used to degrade carbonaceous BOD?
A. Carbonaceous BOD  C. Suspended growth processes
B. Attached growth processes  D. Activated sludge processes

129. Which of the following terms is the amount of food provided to the bacteria in the aeration tank (the food-to-microorganism ratio, F/M)?
A. Carbonaceous BOD  C. Mean cell residence time (MCRT)
B. Attached growth processes  D. Food-to-microorganism ratio, F/M

**Dissolved Oxygen**

130. Aerobic means without air and some bacteria thrive under these conditions and utilize the nutrients and chemicals available to exist.
A. True  B. False

131. At least two general forms of bacteria act in balance in a wastewater digester: Saprophytic organisms and?
A. Methane Fermenters  C. Butyric acid fermenters
B. DO fermenters  D. Carbon dioxide fermenters

132. The saprophytes exist on dead or decaying materials.
A. True  B. False

133. The methane fermenting bacteria require a pH range of 6.6 to 7.6 to be able to live and reproduce.
A. True  B. False

134. Aerobic bacteria do not require oxygen to live and thrive.
A. True  B. False

135. Aerobes decompose inorganics in the water; the result is carbon dioxide and H2SO4.
A. True  B. False

136. Dissolved oxygen (DO) in water is considered a contaminant.
A. True  B. False

137. Dissolved oxygen level is important because too much or not enough dissolved oxygen can create___________________________?
A. Unfavorable conditions  C. Frequent dissolved oxygen measurement
B. DO analysis  D. None of the Above

138. A lack of Dissolved oxygen in natural waters creates?
A. Anaerobic conditions  C. Aerobic Conditions
B. Denitrification  D. None of the Above

139. Which of the following wastewater terms live on the volatile acids produced by these saprophytes?
A. Butyric acid fermenters  C. VFAs
B. Methane fermenters  D. None of the Above
140. Which of the following wastewater terms indicate that dissolved oxygen is present?
A. Sample(s)  C. Aerobic conditions
B. DO analysis  D. None of the Above

**Sludge Volume Index (SVI)**
141. The higher the (SVI), the better is the settling quality of the aerated mixed liquor, low (SVI) of 50 or less is considered a good settling sludge.
A. True  B. False

142. Poor settling sludge causes lower solids concentration requiring higher RAS rates to maintain a given _________________ in the activated sludge basin. Consequently, measuring sludge settleability is fundamental to the operation and control of the biological system.
A. Solid(s)  C. WAS
B. MLSS  D. Sludge

**Primary Treatment**
143. The initial stage in the treatment of domestic wastewater is known as bar screens.
A. True  B. False

144. Coarse solids are removed from the wastewater in the primary stage of treatment. In some treatment plants, ________________ may be combined into one basic operation.
A. Primary and secondary stages  C. Suspended growth process(es)
B. Biological processes  D. None of the Above

145. There are two basic stages in the treatment of wastes, RAS and WAS.
A. True  B. False

146. The secondary stage uses this term to further purify wastewater.
A. Primary and secondary stages  C. Suspended growth process(es)
B. Biological processes  D. None of the Above

**Preliminary Treatment**
147. After the wastewater has been screened, it may flow into a grit chamber where sand, grit, cinders, and small stones settle to the bottom
A. True  B. False

148. Especially in cities with combined sewer systems, removing the-this missing term-that washes off streets or land during storms is very important.
A. Very fine solids  C. Primary sludge
B. Grit and gravel  D. None of the Above

149. The Preliminary Treatment is purely physical stage consisting of Coarse Screening, Raw Influent Pumping, Static Fine Screening, Grit Removal, and Selector Tanks.
A. True  B. False

150. Which of the following terms enters from the collection system into the Coarse Screening process?
A. Raw wastewater  C. Dissolved organic and inorganic constituents
B. Biological processes  D. None of the Above
151. Large amounts of this term entering a treatment plant can cause serious operating problems, such as excessive wear of pumps and other equipment.
A. Solid(s)  
B. Finer debris  
C. Grit and sand  
D. None of the Above

152. In some plants, another finer screen is placed after the grit chamber to remove any additional material that might damage equipment or interfere with later processes.
A. True  
B. False

**Primary Sedimentation**

153. Pollutants that are dissolved or are very fine and remain suspended in the wastewater are easily removed effectively by gravity settling.
A. True  
B. False

154. When the wastewater enters a sedimentation tank, it slows down and the suspended solids gradually sink to the bottom, this mass of solids is called?
A. Very fine solids  
B. Wastewater effluent  
C. Primary sludge  
D. None of the Above

155. When the screening completed and the grit removed, wastewater is clear of dissolved organic and inorganic constituents along with suspended solids.
A. True  
B. False

156. Which of the following wastewater treatment terms consist of minute particles of matter that can be removed from the wastewater with further treatment such as sedimentation or gravity settling, chemical coagulation, or filtration?
A. Solid(s)  
B. Suspended solids  
C. Dissolved organic and inorganic constituents  
D. None of the Above

**Secondary Treatment**

157. The wastewater enters from Preliminary Treatment into the clarifier process which is a biological process consisting of large oval shaped basins that are capable of removing these finer solids.
A. True  
B. False

158. Maintaining a population of microorganisms within the oxidation basins that consumes and also adhere to the solids themselves.
A. Total Solids  
B. TDS  
C. Very fine solids  
D. None of the Above

159. Which of the following terms form larger and heavier aggregates that can be physically separated?
A. Solid(s)  
B. Finer debris  
C. Finer solids  
D. None of the Above

160. The two most common conventional methods used to achieve secondary treatment are:  
A. Attached growth processes  
B. Finer debris  
C. Unsuspended growth process(es)  
D. None of the Above
161. The Secondary Treatment stage consists of a biological process such as _________ and a physical process, Secondary Clarification.
A. Tickling filters   C. Phosphorus-reduction system(s)
B. Oxidation Ditches  D. None of the Above

162. The Preliminary Treatment stage removes as much ________________ as possible using physical processes.
A. Solid(s)   C. Grit and gravel
B. Finer debris  D. None of the Above

**Secondary Clarification Process**
163. The SCP provides quiescent (or calm) conditions that allow the larger aggregates of solids and microorganisms to settle out for collection.
A. True   B. False

164. In the SCP, the majority of microorganism-rich underflow (or lower layer) is re-circulated to Tanks as Return Sludge to help sustain the microorganism population in the?
A. Trickling filter(s)   C. Recirculating sand filters (RSFs)
B. Oxidation Ditches  D. None of the Above

**Lagoon Systems**
165. Lagoon systems are shallow basins that hold the wastewater for several months to allow for the natural degradation of sewage.
A. True   B. False

166. Lagoon systems take advantage of _________ and microorganisms in the wastewater to renovate sewage.
A. Nitrogen removal system(s)   C. Natural aeration
B. Suspended film system(s)  D. None of the Above

**Temperature**
167. The best temperatures for wastewater treatment probably range from 77 to 95 degrees Fahrenheit.
A. True   B. False

168. Hot water is a byproduct of many manufacturing processes, is not a pollutant. When discharged in large quantities, it can raise the temperature of receiving streams improving the natural balance of aquatic life.
A. True   B. False

**Microorganisms in Lagoons**
169. Swimming and _______________ engulf bacteria or other prey.
A. Gliding ciliates   C. Heterotrophic bacteria
B. Predators  D. None of the Above

170. Which of the following bugs or terms attach to the biomass and vortex suspended bacteria into their gullets, while crawlers break bacteria loose from the floc surface?
A. Floc-forming bacteria   C. Stalked ciliate(s)
B. Aerobic bacteria  D. None of the Above
171. Predators feed mostly on stalked and ________________.
A. Floc-forming bacteria  C. Nitrobacter
B. Swimming ciliates  D. None of the Above

172. The following changes in food, dissolved oxygen, temperature, pH, total dissolved solids, sludge age, presence of toxins, and other factors create a dynamic environment for the__________________________?
A. Treatment organism(s)  C. Floc-forming bacteria
B. Aerobic bacteria  D. None of the Above

173. Food (organic loading) regulates______________________________?
A. Strict aerobes  C. Microorganism numbers
B. Predators  D. None of the Above

Aerobic Bacteria
174. Three bacteria groups occur: freely dispersed, single bacteria; floc-forming bacteria; and filamentous bacteria. All function similarly to oxidize organic carbon to produce CO₂ and new bacteria.
A. True  B. False

175. Which of the following bugs or terms are similar to those found in other treatment processes such as activated sludge?
A. Treatment organism(s)  C. Floc-forming bacteria
B. Aerobic bacteria  D. None of the Above

176. Which of the following bugs or terms degrade wastes grow as single bacteria dispersed in the wastewater?
A. Strict aerobes  C. Many bacterial species
B. Predators  D. None of the Above

177. Which of the following bugs or terms grow in a large aggregate due to exocellular polymer production?
A. Predators  C. Floc-forming bacteria
B. Aerobic bacteria  D. None of the Above

178. Growth form is important as these flocs degrade ________________ and settle at the end of the process, producing a low TSS effluent.
A. Anaerobic action  C. BOD
B. Application-specific bacteria  D. None of the Above

179. Which of the following bugs or terms occur in lagoons, usually at specific growth environments?
A. Anaerobic action  C. A number of filamentous bacteria
B. Absence of free oxygen  D. None of the Above

180. Which of the following bugs or terms have a wide range in environmental tolerance and can function effectively in BOD removal over a wide range in pH and temperature?
A. Strict aerobes  C. Most heterotrophic bacteria
B. Predators  D. None of the Above
181. Anaerobic BOD removal generally proceeds well from pH 6.5 to 9.0 and at temperatures from 3-4°C to 60-70°C (Aerobic bacteria are replaced by Mesophilic bacteria at temperatures above 35°C).
A. True   B. False

182. BOD removal increases rapidly below 3-4°C and ceases at 1-2°C.
A. True   B. False

183. A very specialized group of bacteria occurs to some extent in lagoons (and other wastewater treatment systems) that can oxidize ammonia via nitrite to nitrate, termed?
A. Strict aerobes    C. Nitrifying bacteria
B. Predators        D. None of the Above

Aerated lagoons
184. The aerated lagoons are basins, normally excavated in earth and operated without Solids recycling into the system. This is the major difference with respect to activated sludge systems.
A. True   B. False

185. Two types are the most common: The Aerobic-anaerobic or partially suspended lagoon in which the concentration of solids and dissolved oxygen are maintained fairly uniform and neither the incoming solids nor the biomass of microorganisms’ settle, and the completely mixed lagoon.
A. True   B. False

186. In the facultative lagoons, the power input is reduced causing accumulation of solids in the bottom which undergo______________, while the upper portions are maintained aerobic.
A. Facultative lagoon(s)    C. Dissolved organic and inorganic constituents
B. Anaerobic decomposition   D. None of the Above

Anaerobic Bacteria
187. Which of the following bugs or related terms commonly occur in lagoons are involved in methane formation and in sulfate reduction?
A. Nitrifying bacteria   C. Anaerobic, heterotrophic bacteria
B. Methane forming bacteria  D. None of the Above

188. Anaerobic methane formation involves _____________ bacteria.
A. Three different groups of anaerobic    C. Organic overloading conditions
B. Methane fermentation                  D. None of the Above

189. Which of the following bugs or related terms many genera of anaerobic bacteria hydrolyze proteins, fats, and polysaccharides present in wastewater to amino acids?
A. Nitrifying bacteria    C. General anaerobic degraders
B. Methane forming bacteria  D. None of the Above

Activated Sludge Process Section
190. Aerobic is a condition in which free or dissolved oxygen is present in the aquatic environment.
A. True   B. False
191. Aerobic Bacteria will live and reproduce only in an environment containing oxygen.
A. True B. False

192. When oxygen chemically combined, such as in water molecules can be used for respiration by aerobes
A. True B. False

193. Anaerobic- a condition in which “free” or dissolved oxygen is not present in the aquatic environment.
A. True B. False

194. Saprophytic bacteria thrive without the presence of oxygen.
A. True B. False

195. Anaerobic Bacteria that break down complex solids to volatile acids.
A. True B. False

196. Methane Fermenters – bacteria that break down the volatile acids to methane, carbon dioxide and water.
A. True B. False

197. Reduction is the addition of oxygen to an element or compound, or removal of hydrogen or an electron from an element or compound in a chemical reaction.
A. True B. False

198. Oxidation is the addition of hydrogen, removal of oxygen or addition of electrons to an element or compound.
A. True B. False

199. Under anaerobic conditions in wastewater, sulfur compounds or elemental sulfur are reduced to H₂S or sulfide ions.
A. True B. False

Basic System Components of Activated Sludge

200. In the activated sludge process, the wastewater enters an aerated tank where previously developed biological floc particles are brought into contact with the organic matter of the wastewater.
A. True B. False

201. The organic matter is a carbon and an energy source for the bug’s cell growth and is converted into cell tissue. The oxidized endproduct is mainly carbon dioxide, CO₂.
A. True B. False

202. Mixed liquor is suspended solids and consists mostly of microorganisms, suspended matter, and non-biodegradable suspended matter (MLVSS).
A. True B. False
Nitrification
203. Nitrosomonas europaea, which oxidizes ammonia to nitrite, and Nitrobacter winogradskyi, which oxidizes nitrite to nitrate.
A. True  B. False

204. Which of the following bugs require a neutral pH and substantial alkalinity?
A. Nitrifying bacteria  C. Anaerobic, heterotrophic bacteria
B. Methane forming bacteria  D. None of the Above

205. Nitrification ceases at pH values above pH 9 and declines markedly at pH values below 7.
A. True  B. False

206. Nitrification is a major pathway for nitrogen removal in lagoons.
A. True  B. False

207. Nitrifying bacteria exists in low numbers in lagoons, they prefer attached growth systems and/or?
A. Nitrifying bacteria  C. High MLSS sludge systems
B. Low MLSS sludge systems  D. None of the Above

Activated Sludge Methods
Organic Load
208. The organic load (generally coming from primary treatment operations such as settling, screening or flotation) enters the reactor where the active microbial population is present. The reactor must be continuously aerated.
A. True  B. False

209. The mixture then passes to a settling tank where the cells are settled. The treated wastewater is disinfected while the secondary settling and is recycled in part to the aeration basin.
A. True  B. False

210. According to the text, as the cells are retained longer in the system, the flocculating characteristics of the cells improve since they start to produce extra cellular slime that favors?
A. Secondary settling  C. Flocculating
B. High degradation rate  D. None of the Above

Common Types
211. The most common types of activated sludge are the conventional and the continuous flow stffed tank, in which the contents are completely mixed. In the conventional process, the wastewater is circulated along the aeration tank, with the flow being arranged by baffles in plug flow mode. The oxygen demand for this arrangement is maximum at the inlet as is the organic load concentration.
A. True  B. False

30
Photosynthetic Organisms

212. Which of the following bugs or related terms is a diverse group of bacteria that converts products from above under anaerobic conditions to simple alcohols and organic acids?
A. Acid-forming bacteria  
B. Methane bacteria  
C. Aerobic bacteria  
D. None of the Above

213. Which of the following bugs or related terms these bacteria convert formic acid, methanol, methylamine, and acetic acid under anaerobic conditions to methane?
A. Nitrifying bacteria  
B. Methane forming bacteria  
C. General anaerobic degraders  
D. None of the Above

214. A problem exists at times where the acid formers overproduce organic acids, lowering the pH below where the methane bacteria can function (a pH < 6.5). This can stop methane formation and lead to a buildup of sludge in a lagoon with a low pH. In an anaerobic fermenter, this is known as a "stuck digester".
A. True  
B. False

215. Which of the following bugs or related terms are environmentally sensitive and have a narrow pH range of 6.5-7.5 and require temperatures > 14° C.
A. Acid-forming bacteria  
B. Methane bacteria  
C. Aerobic bacteria  
D. None of the Above

216. Which of the following bugs or related terms that the products of these bugs become the substrate for the methane producers?
A. Acid formers (principally acetic acid)  
B. Methane bacteria  
C. Aerobic bacteria  
D. None of the Above

217. Which of the following bugs or related terms ceases at cold temperature?
A. Acid-forming bacteria  
B. Methane fermentation  
C. Aerobic bacteria  
D. None of the Above

218. Which of the following bugs or related terms can use sulfate as an electron acceptor, reducing sulfate to hydrogen sulfide?
A. Nitrifying bacteria  
B. Methane forming bacteria  
C. Sulfate reducing bacteria  
D. None of the Above

219. Which of the following bugs or related terms is a major cause of odors in ponds?
A. Sulfate reduction  
B. Methane fermentation  
C. Acid-forming bacteria  
D. None of the Above

220. Which of the following bugs or related terms and represented by about 28 genera, oxidize reduced sulfur compounds using light energy to produce sulfur and sulfate?
A. Nitrifying bacteria  
B. Methane forming bacteria  
C. Red and green sulfur bacteria  
D. None of the Above

221. Which of the following bugs or related terms that can grow in profusion and give a lagoon a pink or red color?
A. Chromatium, Thiocystis, and Thiopedia  
B. Methane bacteria  
C. Acid-forming bacteria  
D. None of the Above
222. According to the text, conversion of odorous sulfides to sulfur and sulfate by these bugs is a significant odor control mechanism in facultative and anaerobic lagoons.

A. Methane bacteria  C. Acid-forming bacteria
B. Sulfur bacteria  D. None of the Above

Activated Sludge Process Terms

Excess Solids
223. Solids are generated by microorganism growth and reproduction. The influent BOD supplies the food for the growth and reproduction. As microorganisms’ populations multiply, excess solids (microorganisms) must be removed (wasted).

A. True  B. False

Final Clarifier Solids Loading Rate (SLR)
224. The rate at which the activated sludge is returned from the final clarifiers to the aeration basins, along with the influent flow, effects the flow of solids into the clarifiers.

A. True  B. False

Clarifier Sludge Blanket
225. Solids settle and concentrate in the first clarifier forming a sludge blanket. The sludge blanket can increase depending on the WAS flow rate. The proper WAS flow rate allows for a desired sludge blanket.

A. True  B. False

Filaments
226. Filamentous organisms are a group of thread-like organisms that, when in excess, can impair the settling of activated sludge and create a bulking condition in the final clarifier.

A. True  B. False

Oxidation Ditch
227. Oxidation ditches are typically limited mix systems, and cannot be modified to approach plug flow conditions.

A. True  B. False

Pin Floc
228. Very fine floc particles with poor settling characteristics, usually indicative of a young sludge (high MLSS levels).

A. True  B. False

Sludge Age
229. Activated sludge (RAS) is recycled back through the aeration basins by returning settled sludge in the final clarifiers and thus remains in the activated sludge system for a number of days. For effective treatment, a specific sludge age is desired for the type of activated sludge system.

A. True  B. False

230. For conventional activated sludge, a sludge age of 1-3 days is typical. For extended aeration activated sludge, older sludge ages of 3-10 days are common. F/M ratio and sludge age is inversely related (1 divided by the sludge age approximates the F/M ratio).

A. True  B. False
**Constant MLSS (Mixed Liquor Suspended Solids)**

231. Provided the influent loadings are constant, the operator maintains a relatively constant solids inventory (MLSS level) in the aeration basins for a desired level of treatment. The range of MLSS is typically between 1000-4000 mg/L.
A. True   B. False

**Wasting Rates**

232. The concentration of WAS has a direct bearing on how much to waste and the volume wasted. On a volume basis, a thicker waste activated sludge (low WAS concentration) will require more amount of wasting than a thicker waste activated sludge (high WAS concentration).
A. True   B. False

**Extended Aeration Activated Sludge Plants**

233. For extended aeration activated sludge plants the range is between about 15 and 30 days. Generally, during the winter months, higher sludge ages are required to maintain a sufficient biological mass. In the summer time, biological activity increases and lower sludge ages normally produce a higher quality effluent.
A. True   B. False

**Clarifier Sludge Blanket**

234. Solids settle and concentrate in the final clarifiers forming a sludge blanket. The sludge blanket can increase or decrease depending on the RAS flow rate. The proper RAS flow rate allows for a desired sludge blanket.
A. True   B. False

**Young Sludge**

235. Young sludge is often associated with a low F/M. To correct for young sludge, it is necessary to increase wasting rates. This will decrease the amount of solids under aeration, reduce the F/M ratio, and increase the sludge age.
A. True   B. False

**Excessive Old Sludge**

236. The required pressure is an increase in the total system sludge mass. Decreased wasting is required to accomplish that objective. This problem is very rare.
A. True   B. False

**Return Rates Too Low**

237. Thin mixed liquor suspended solids and a sludge blanket build-up of solids. Rising clumps of sludge or gas bubbles may occur in the final clarifier.
A. True   B. False

**Return Rates Too High**

238. A sludge blanket in the final clarifier and a thick return activated sludge.
A. True   B. False
**Denitrification in Final Clarifier**

239. In the absence of oxygen, a sludge blanket that is too thick and remains in the clarifier too long can denitrify. Nitrates in the sludge will be converted to nitrogen gas. The release of nitrogen gas will cause small gas bubbles that will be observed at the clarifier surface. Clumps of sludge may also rise to the surface.

A. True  B. False

**Old Sludge**

240. Old sludge filaments include M. parvicella, Type 0041, Type 0675, Type 1851 and Type 0803. M.parvicella is known for causing foaming and bulking occurrences, especially during winter operating conditions, in WWTPs that must remove ammonia year-round.

A. True  B. False

**Stable Nitrification**

241. At a water temperature of 20°C, the washout SRT for AOBs is approximately 1.6 weeks and the washout for POAs is approximately 2.0 days. To maintain a stable population and to avoid accidental loss of these bacteria resulting from accidental overwasting, the target SRT would need to be two to three times as long or between 1 and 3 days.

A. True  B. False

**Slimy Foam**

242. A grayish slimy foam that is very thick is commonly caused by nutrient deficiencies. It is often noted with a slime bulking condition.

A. True  B. False

**Foam Trapping**

243. A long-term solution includes some facilities using a vacuum truck to remove the foam from the surface. A short-term solution includes eliminating grease from the influent.

A. True  B. False

**Bacteria and Temperature Effect**

244. Washout SRT is affected by temperature. For every 10°C drop in water temperature, the growth rate of bacteria decreases by 50% and the _______________ doubles. Growth rates for floc forming and filament forming bacteria are similarly affected.

A. MLSS  C. Washout SRT  
B. CBOD  D. WAS

**Denitrification**

245. When ______________ flow rates are too low, thin sludge blankets in the final clarifier can result. The operator will see gas bubbles (from ammonia gas) and rising/floating sludge clumps on the clarifier surface.

A. MLSS  C. RAS  
B. CBOD  D. WAS
Food -To- Microorganism Ratio (F/M Ratio)
246. For microbiological health and effective treatment, the microorganisms (mixed liquor suspended solids) under aeration should be maintained at a certain level for the amount of food (influent BOD) coming into the plant. This is known as the____________________.
A. MLSS  C. Food to microorganism ratio
B. CBOD  D. WAS

Nutrient Section
Total Kjeldahl Nitrogen
247. The TKN content of influent municipal wastewater is typically between 5,000 and 6,000 mg/L.
A. True  B. False

248. Organic nitrogen compounds in wastewater undergo microbial conversion to NH₃ and ammonium ion NH₄⁺.
A. True  B. False

249. Recalcitrant means a certain compound is difficult to break down. This material can often be broken down given enough time, but not within the time it spends in secondary treatment.
A. True  B. False

250. Inert means the material is safe for all microorganisms.
A. True  B. False

Ammonia
251. Ammonia is a nutrient that contains__________________. Its chemical formula is NH₃ in the un-ionized state and NH₄⁺ in the ionized form.
A. Nitrogen and hydrogen  C. Phosphate
B. Total ammonia  D. Both total and unionized ammonia

252. Ammonia results can be expressed as: total ammonia (mg/l), un-ionized ammonia (mg/l), total ammonia (as N, mg/l), un-ionized ammonia (____________________).
A. µg/l  C. As N, mg/l
B. mg/l/day  D. mg/l

Nitrification
253. Nitrification is an anaerobic process in which heterotrophic bacteria oxidize carbon for energy production.
A. True  B. False

254. Nitrification is normally a one-step aerobic biological process for the oxidation of ammonia to nitrate.
A. True  B. False
255. Ammonia-nitrogen (NH$_3$-N) is first converted to nitrite (NO$_2^-$) by ammonia oxidizing bacteria (AOB). The nitrite produced is then converted to nitrate (NO$_3^-$) by nitrite oxidizing bacteria (NOB). Both reactions usually occur in the same process unit at a wastewater treatment plant (e.g., activated sludge mixed liquor or fixed film biofilm).
A. True  B. False

**Nitrifying Bacteria**
256. Ammonia can be converted into nitrite and nitrate by nitrifying bacteria. Effluent ammonia-nitrogen (NH$_3$-N) concentrations less than 1 mg/L NH$_3$-N are achievable.
A. True  B. False

**Autotrophic Bacteria**
257. AOB and NOB are classified as autotrophic bacteria because they derive energy from the oxidation of reduced inorganic compounds (in this case, nitrogenous compounds) and use inorganic carbon (CO$_2$) as a food source.
A. True  B. False

**Significant Amount of Oxygen**
258. Nitrifying bacteria require a significant amount of oxygen to complete the reactions, produce a small amount of biomass, and cause destruction of alkalinity through the consumption of carbon dioxide and production of hydrogen ions.
A. True  B. False

**Nitrogen Gas**
259. Nitrate can be converted to nitrogen gas by a variety of autotrophic bacteria. The nitrogen gas is returned to the digester.
A. True  B. False

260. Nitrate removal is limited by the amount of COD available.
A. True  B. False

**Total Inorganic Nitrogen (TIN)**
261. Total inorganic nitrogen (TIN) as low as 5 mg/L N can be met through biological nitrification and denitrification.
A. True  B. False

**Total Nitrogen**
262. Total nitrogen in domestic wastewater typically ranges from 1.5 to 2.0 mg/L for low to high strength wastewater.
A. True  B. False

263. Factors affecting concentration include the extent of infiltration and the presence of industries. Influent concentration varies during the day and can vary significantly during rainfall events, as a result of inflow and infiltration to the collection system.
A. True  B. False
Conversion of Nitrate to Nitrogen Gas
264. The conversion of nitrate to nitrogen gas is accomplished by bacteria in a process known as denitrification. Effluent with nitrogen in the form of nitrate is retained in a tank that lacks oxygen, where carbon-containing chemicals, such as methanol, are added or a small stream of raw wastewater is mixed in with the nitrified effluent.
A. True B. False

265. In this oxygen free environment, bacteria use the oxygen attached to the nitrogen that is in the nitrate form, then the nitrogen gas is released.
A. True B. False

266. Because nitrogen contains almost 50 percent of the earth’s atmosphere, the release of nitrogen into the atmosphere causes a small amount of global warming.
A. True B. False

Phosphorus Section
267. Total phosphorus (TP) in domestic wastewater typically ranges between ______________ mg/L but can be higher depending on industrial sources, water conservation, or whether a detergent ban is in place.
A. 4 and 8 C. 100 to 500
B. 2 and 4 D. 1,000 – 2,000

268. The ______________ fraction is soluble and can be in one of several forms (e.g., phosphoric acid, phosphate ion) depending on the solution pH.
A. Orthophosphate C. Phosphoric acid, phosphate ion
B. Phosphorus D. Total phosphorus (TP)

269. Polyphosphates are high-energy, condensed ______________ such as pyrophosphate and trimetaphosphate. They are also soluble but will not be precipitated out of wastewater by metal salts or lime. They can be converted to phosphate through hydrolysis, which is very slow, or by biological activity.
A. Polyphosphates C. Phosphates
B. Phosphorus D. Total phosphorus (TP)

270. ______________ can either be in the form of soluble colloids or particulate. It can also be divided into biodegradable and non-biodegradable fractions.
A. Organically bound phosphorus C. Soluble biodegradable phosphorus
B. Phosphorus D. Particulate organically bound phosphorus

271. ______________ is generally precipitated out and removed with the sludge.
A. Organically bound phosphorus C. Soluble biodegradable phosphorus
B. Phosphorus D. Particulate organically bound phosphorus

272. ______________ can be hydrolyzed into orthophosphate during the treatment process.
A. Polyphosphate C. Particulate organically bound phosphorus
B. Phosphorus D. Soluble organically bound non-biodegradable phosphorus
Biological Phosphorus Control
273. Phosphorus removal can be achieved through chemical addition and a coagulation-sedimentation process discussed in the following section. Some biological treatment processes called biological nutrient removal (BNR) can also achieve nutrient reduction, removing _________________________.
A. Polyphosphate  C. Both nitrogen and phosphorus
B. Phosphorus  D. Soluble organically bound non-biodegradable phosphorus

Phosphate Accumulating Organisms (PAOs)
274. PAOs accomplish removal of phosphate by accumulating it within their cells as _______.
A. Polyphosphate  C. Both nitrogen and phosphorus
B. Phosphorus  D. Soluble organically bound non-biodegradable phosphorus

Production of Polyphosphate
275. PAOs are by no means the only bacteria that can accumulate __________________within their cells and in fact, the production of polyphosphate is a widespread ability among bacteria.
A. Polyphosphate  C. Phosphoric acid, phosphate ion
B. Phosphorus  D. Total phosphorus (TP)

Luxury Uptake
276. In an anaerobic secondary treatment process, some of the CBOD is broken down through fermentation by anaerobic bacteria into soluble CBOD and simpler organic molecules called _____________.
A. COD  C. Carbon and energy
B. VFAs  D. ATP

277. Volatile fatty acids are a preferred source of ________________ by heterotrophic bacteria, including the PAOs, because these compounds are easily absorbed into the bacteria.
A. COD  C. Carbon and energy
B. VFAs  D. ATP

Logistical Problem
278. The PAOs have a logistical problem: When PAOs are under anaerobic conditions, they are exposed to __________, but without oxygen, nitrite or nitrate present, they cannot access them.
A. COD  C. Carbon and energy
B. VFAs  D. ATP

Adenosine Triphosphate (ATP) Energy
279. The PAOs take ATP to the next level and form an energy-rich compound called__________________, which strings together large numbers of phosphate molecules.
A. Polyphosphate  C. Carbon and energy
B. VFAs  D. ATP
**Chemical Precipitation of Phosphorus**
280. Phosphorus can also be precipitated through chemical addition. Alum, ferric chloride, or lime can be added to wastewater where these chemicals combine with phosphorus to form a solid. The precipitate is removed by settling or filtration.
A. True  B. False

281. Chemical phosphorus removal can meet effluent levels as low as 0.03 mg/L TP. Chemical and biological phosphorus removal methods are often used together in various combination processes.
A. True  B. False

**Tertiary Filtration**
282. WWTPs typically use biological phosphorus removal methods to reduce P concentrations above 50 mg/L as P followed by chemical precipitation at or after the secondary clarifier.
A. True  B. False

283. Achieving effluent phosphorus concentrations below 50 mg/L as P depends upon getting good solid removal in the secondary clarifiers.
A. True  B. False

284. Solids that escape into the final effluent generally do not contain Nitrogen and phosphorus.
A. True  B. False

285. Many WWTPs are equipped with advanced or tertiary filters to ensure solids capture.
A. True  B. False

**Biological Phosphorus Removal and Combination Processes**

**Principles**
286. Biological phosphorus removal is achieved by contacting phosphorus accumulating organisms (PAOs) in the RAS with feed, containing volatile fatty acids (VFA), in a zone free of nitrates and DO (anaerobic zone).
A. True  B. False

287. Phosphorus is released in this zone providing energy for uptake of VFAs that are polymerized and stored inside the PAO cells.
A. True  B. False

**Fuhs & Chen Theory**
288. PAOs have the ability to store a large mass of ____________________ in their cells in the form of polyphosphates.
A. Carbon  C. Poly-β-hydroxybutyrate (PHB)
B. Phosphorus  D. Magnesium and potassium ions
University of Cape Town (UCT) and Modified UCT (MUCT)
289. The UCT process was designed to reduce _________________ to the anaerobic zone when high removal of nitrates in the effluent is not required. It consists of three stages: an anaerobic stage, an anoxic stage, and an aerobic stage.
A. Nitrates  C. An anoxic zone
B. A nitrate rich stream  D. An aerobic stage

290. The _________________ is returned from the clarifier to the anoxic zone instead of the anaerobic zone to allow for denitrification and to avoid interference from nitrate with the activation of the PAOs in the anaerobic stage.
A. RAS  C. A nitrate-rich liquor
B. WAS  D. Denitrified mixed liquor

Johannesburg (JHB), Modified Johannesburg and Westbank
291. The JHB process is similar to the 3 Stage Pho-redox process, but has a pre-anoxic tank ahead of the anaerobic zone to protect the zone from nitrates when low effluent nitrates are not required. The low COD of the wastewater limited the de-nitrification capacity in the original plant (Northern Works), resulting in nitrates in the _________________.
A. RAS  C. An anoxic zone
B. Pre-anoxic zone  D. An aerobic stage

Oxidation Ditches
292. There are several oxidation ditch designs that can remove phosphorus. They normally consist of an anaerobic zone ahead of the oxidation ditch whereas simultaneous ________________ takes place within the ditches.
A. Anaerobic  C. Nitrification and denitrification
B. Oxidation  D. Anaerobic and aerobic zones

293. Oxidation ditches typically operate as racetrack configurations around a central barrier, with forward ________________ flows of approximately 1 foot per second or more. It is possible, by manipulating the DO transferred to the mixed liquor, to establish both anoxic, aerobic and near anaerobic zones within the racetrack configuration, even though the high flow velocities accomplish complete mixing of the wastewater with the RAS.
A. Mixed liquor  C. DO
B. RAS  D. WAS

Sequencing Batch Reactors (SBR)
294. SBRs are fill-and-draw reactors that operate sequentially through the various phases by means of adjusting the mixing and aeration. The ________________ can be set and automated to allow the mixed liquor to go through an anaerobic/anoxic/aerobic progression as is necessary for removal of phosphorus and nitrates.
A. Supernatant stream  C. Primary sedimentation
B. Reactor phases  D. Secondary clarifier

295. Because of the fill-and-draw nature of SBRs, it actually is necessary to remove the nitrates remaining from the previous cycle before anaerobic conditions can be established, thus the typical treatment progression becomes _________________.
A. Anaerobic zone  C. Anoxic/anabiotic/aerobic
B. Oxidized  D. Anaerobic and aerobic zones
Principles
296. Chemical precipitation for phosphorus removal is a reliable wastewater treatment method that has not significantly changed over the years. To achieve removal, coagulant aids such as sodium hydroxide are added to wastewater where they react with soluble phosphates to form mixed liquor.
A. True  B. False

297. Chemical precipitation is typically accomplished using either lime or a metal salt such as aluminum sulfate (alum) or as mentioned iron salts such as ferric chloride. The addition of polymers and other substances can further enhance floc formation and solids settling.
A. True  B. False

298. Plant operators can use existing secondary clarifiers or retrofit primary clarifiers for removal of sludge.
A. True  B. False

Chemical Dose
299. The required chemical dose is related to the liquid phosphorus concentration. For target concentrations above 20 mg/L (appropriate for chemical addition to a primary clarifier), a dose of 10 moles of aluminum or iron per mole of phosphorus is sufficient.
A. True  B. False

Aluminum and Iron Salts
300. Alum and ferric or ferrous salts are commonly used as coagulant and settling aids in both the water and wastewater industry. Ferric is less corrosive than Alum without drastic changes to pH, creates less sludge, and is more popular with operators when compared to lime which increases the pH.
A. True  B. False
